## ur rig on which ur gonna play crysis

Posted by easternbrain - 2007/07/24 22:26

---

as wondering if ya all are gonna update for crysis? and what PC setting are you gonna be playing on?? my rig:

1. Intel Core 2 Duo 1.83 GHz.
2. nVidia gfx card with 256 mb ram (dont remember the make number).
3. 1 GB ram.
4. 128mb BFG Phsyx card.
5. 19 inch samsung monitor

im sure i can Crysis play on this..

Well i will buy only a GFX card for the beginning and Vista, got quite decent specs atm, my EE6600 still running at 2.9ghz might OC it a bit further for Crysis to 3.2Ghz or something, later on maybe Quad core processor , and my 22" Belinea will do the job !

well about your specs ,what sorte of Video card is that you got over there , don't forget that you need atleast Graphics card which supports Shader Model 2.0 , or no Crysis for you =/ I know, I know sad but true :/

Anyway i would recomend you to update PC for Crysis if you are really willing to play it and enjoy the eye candy :)

I have a new rig as of today which should play Crysis on high or better. I am still waiting for my PSU to arrive (1000 Watt Enermax Galaxy)and I will buy another identical graphics card when the get cheaper. Still, it should run it well with just the one card. Here is a pic as it arrived this morning in the post:

Wendigo Christmas has come early for you :D, wonder if Xmas is going to come early for me?

i should make a donate button soly on my name so when you click on it, goes straight to the donation page :D

---

So you can put one dvd in drive 1 and copy it straight to drive 2 without first having to copy it to the hard drive.

Sorry for OT but must say it: Good choice ;) PS3 rly kick ass. Shame that Crytek can't do port of Crysis for PS3 - full details only for 600E and in full HD (if you got a TV :D) - like UT III.

EDIT: Vairo ... upcoming RV670 and R680 will kick nvidia's ass. They have support dx 10.1 (free aa) and they will be cheaper. max 259\$ for RV670 (more performance than 2900 XT - your card). R680 probable be rival of gf 9800.

---

It's from there

:) But well this price is for USA. In EU probably it will cost same amount but in euro instead of \$ :) It's still cheap for me and I rly rly wish AMD/ATI to kick nvidia's ass,

Anyway, I'm thinking of buying laptop instead of PC, my studies will force it on me hhehe. Hope that soon will be some better notebooks to run Crysis well. (yeah, yeah there is some 'extreme' gaming notebooks, but I can't afford them)

Running the game at 1680x1050 on a "22 screen  
Q6600 @ 3.6ghz  
Leadtek 8800GTX @ 620/2200mhz  
4GB PC6400 @ 800mhz
